On 5–7 September 1993, 10 September 1993, and 27–29 September 1995, single samples were taken with a Ponar grab at stations on a regular grid throughout San Pablo and Suisun Bays. This grab sampled about 0.0526 m² of the bottom to a depth in the sediments of about 10 cm. All *Corbula* (and no other species) retained by a 0.595-mm sieve were counted and their shell lengths measured to the nearest 0.1 mm. Biomass estimates were added to the dataset using standard conversions.

Coordinates are in meters, UTM zone 10 coordinate system, North American Datum 1983 and 1984 and have been verified to be accurate for 1:24,000 scale mapping.
